Acknowledgment

I must express my gratitude to several scientific institutes and institutions which enabled me to complete this book on Public Health Genomics and International Wealth Creation. The generous funding from the National Institutes of Health on genetic epidemiology of hemoglobinopathies in Louisiana, USA created so many insights into the relevance of gene-chromosome variants in the onset of doubly homozygous, autosomal recessive genes. As a friend of NIH and US Department of Energy, I remain extremely grateful for the state of the art medical and scientific literature on genomics made available to me on a regularly basis. The Wellcome Trust Foundation provided the funding and the resources to facilitate our comprehensive research on the impact of sickle cell disease on human anthropometric indicators. As one of the most comprehensive, world-renowned academic institutions in United States, the University of Illinois, Urbana-Champaign provided unimaginable academic resources and support for me, as one of institution’s alumni. I am deeply indebted to Professor Gene Robinson Director, of the Institute of Genomic Biology (IGB) at University of Illinois at Urbana-Champaign for inviting us to the center. We are very grateful for his hospitality. Mr. Timothy P. Kerestes, Director of the Operations and Facilities at IGB, took us on a learning tour of the existing resources at the Institute in 2010. By October 24th, 2014, professor William Kramer, Blue Waters Director at the National Center for Supercomputing Applications at the University of Illinois, Urbana-Champaign, Illinois meticulously explained unsurpassed technological potential and resources at NCSA. We found that Blue Waters is now the fastest, and one of the most powerful supercomputers in the world. With genomic science necessitating knowledge about “Big Data” analysis, scientists and engineers across the country use the NCSA and the data power of Blue Waters to solve a wide range of challenging scientific problems; from predicting the inherent behavior of complex biological systems to simulating the evolution of the cosmos (NCSA, Blue Waters, 2014).

Majority of the literature used for this textbook, were acquired from the Northwestern Memorial Health Care Library located at 251 E. Huron Street, Suite 3-304, Chicago Illinois 60611, USA. The librarians there conscientiously sought and retrieved manuscripts that were published in medical and public health genomics from European, United States and Asian scientific journals and periodicals. I owe a debt of gratitude to Ms. Nora St James whose official activities, I routinely interrupted while searching for many innovative medical resources and information.

As with many writing endeavors, this book is the product of many individuals whose names do not appear on any of the cover pages. Primarily, I would like to thank my wife, Dr. Josephine Ebomoyi molecular biologist, at Saint Xavier University Chicago, Illinois; and our children for their cooperation. I am extremely grateful to my mentors in Illinois for teaching me to understand the broad range of quantitative sciences, clinical sciences, public health, bio-statistical techniques, and the relevance of scientific re-
search. Late professors William and Jean Creswell, Jr. always motivated their mentees echoing, “When you shine, you make us shine”. Special acknowledgements are due to Drs. Kelly Creswell and Jerry Ogbudimenka, Director of Health Education at the University of Illinois at Urbana-Champaign, Illinois. Dr. Charles Meliska, Emeritus Professor of psychology being one of my mentors at Monmouth College, has been a role model for many of us. From him, I learned of the linkages between animal behavior and psychopharmacological research. Grateful acknowledgements also go to Drs. S. W. Fors, Rudolph Mortimer, Carolyn W. Rollins, O. K. Alausa, K. Omonisi, Luke D. Edungbola, and Bayo Parakoyi and, late professor Donald B. Stone of University of Illinois, at Urbana-Champaign, Ill. Portions of this book on hemoglobinopathies were edited by Drs. F. A. Wickremasinghe and A. R. Wickremasinghe. Many of my colleagues at Chicago State University provided much inklings about administrative duties and I gleaned so much information from Dr. JA Balogun, and Dean, L Roundtree, and Drs. Thomas Britt and P. Bassey Williams and Karen Kim of the University of Chicago, Illinois. I am particularly indebted to Professor Flora Finch, my preceptor at the Tulane University Medical Center, who has sacrificed a great deal to support me throughout my post-doctoral training at the Tulane Medical Center, School of Public Health and Tropical Medicine. I am also grateful to Dr. Assaf A. Abdelghani Prof. and former Chair, Department of Environmental Health Sciences, Tulane University School of Public Health of Tropical Medicine, New Orleans, Louisiana 70112, USA. At the post-doctoral level, Dr. Abdelghani was instrumental in honing our skills on advanced environmental epidemiology even before the catastrophic impact of Katrina.

Without the cooperation of Mr. and Mrs. J. U. Iredia, this project would not have been completed. I am grateful to many of my colleagues at the University of Northern Colorado who eased the process of my settling in Greeley, Colorado. I owe a debt of gratitude to Dean Vincent Scalia, Professors Larry Harrison, Bill Parkos, Bryan Cooke and Mr. Jerry Wones, the former mayor of the City of Greeley, Colorado and Senator Hank Brown the former President of University of Northern Colorado, Greeley Colorado.

Finally, I wish to acknowledge the efficient and humane communication, and the contribution to this book by Mr. Brandon Carbaugh Development Editor, and Ms. Hayley Kang, Editorial Assistant—Book Development, Editorial Content Department IGI Global, International Publisher of Progressive Academic Research Hershey, PA 17033-1240, USA.
