Acknowledgment

I would like to thank and acknowledge the reviewers, colleagues, family, and friends that have helped to make this book a possibility. Innumerable appreciations go to all the authors who contributed. The commitments and generosity of these experts, drawn from both the academic and business communities, lessened the challenge of producing this volume. To Elizabeth Ardner and Dave DeRicco of IGI Global, thank you for your guidance and direction throughout the course of this project.

The resources to develop this book were facilitated by multiple fellowships I received during my doctoral program in the Johns Hopkins University, Baltimore: The Whiting School of Engineering fellowship, United States National Science Foundation Engineering Research Center - CISST fellowship, Jay D. Samstag fellowship. The Jay D. Samstag fellowship partly provided the seed resources that facilitated the establishment of my nongovernmental, US-based, African Institution of Technology (AFRIT). Through AFRIT, I have developed relationships to more than twelve African universities, giving workshops and seminars on microelectronics and nanotechnology. My chapter in this book was funded from resources from this fellowship. I also appreciate the supports from the Electrical Manufacturing & Coil Winding Association and the United Kingdom Congress on Computer Assisted Orthopaedic Surgery-DePuy fellowships during the course of my program.

I also express my appreciation to the World Economic Forum and African Union Congress for their invitations. The Congress of African Economists provided lots of insights on the plights of Africa and developing world in general. I thank the African Union for providing the resources that enabled my participation.

Many contributors in this book have used data drawn from many sources: World Bank, International Monetary Fund, International Telecommunication Union, World Economic Forum, United Nations, African Development Bank, Asian Development Bank, European Union, Banco Interamericano de Desarrollo, Ford Foundation, among others. They have also interviewed experts and used primary data from universities and professional websites. To all these organizations and individuals, I want to express my appreciation for allowing them to use these data.

Having authored one of the earliest works on the influence of information technology in the Nigeria’s banking and finance sectors while in Diamond Bank, Lagos, it becomes natural to thank my colleagues and advisors that enabled that effort: Dr. C. K. Ayo, Dr. O. Oyebanji, Prof. D. Iornem, and Prof. A. Aju. Those works were very instrumental in understanding how technology influences industrial dynamics and paved the way for this work. It also shaped my interests in technology transfer, diffusion and competitiveness despite a pursuit of joining the league that makes these innovations practically possible.

Let me express my gratitude to Prof. Valentine U. James and Renzo Tomellini for writing the forewords to this book. I also appreciate all the contributors, whose works could not be included in this book due to editorial constraints.
Finally, I am indebted to the United States National Science Foundation ERC-CISST Education & Diversity committee in the Johns Hopkins University where I served for more than four years. Through workshops and seminars, I picked vital ideas on the role of technology in any modern economy and how technology progress could be sustained. The Institute of Neuromorphic Engineering (INE) and University of Maryland, Baltimore provided funds that took me to the prestigious Telluride Neuromorphic Workshop where the future of neural microelectronics is crafted. All these broadened my universe of technology policy, economics, and practice in no small measure.

To my Ph.D. advisor, Prof. R. Etienne-Cummings, I am indeed very thankful. He nurtured the confidence in me to not just write about microelectronics and nanotechnology economics, but also to stay in the forefront of advancing the fields. He accommodated my continuous interests on technology economics and policy despite engaging in advancing the field of robotics, alternative energy and biomedical engineering.

Finally, to my wife and best friend, Christiana (Ifeoma), thank you for your support, love and helping to review sections of this book.
