Acknowledgment

Several individuals contributed to making this book come to fruition. I am grateful to the authors who worked with me through numerous drafts. I am indebted to the individuals who served on the editorial advisory board providing comments and suggestions throughout. I would especially like to thank Linda Morales, Richard Epstein, J. Ekstrom, Mario Garcia, Sydney Liles, John Springer, Cassio Goldschmidt, Katie Shilton, and Jeff Burke for their involvement throughout.

I am thankful for the graduate students in my Fall, 2009 Information Assurance and Security Ethics class who carefully read and deliberated most of these chapters. I learned from listening to them talk about the ideas and issues presented in these chapters. Not only did they give me feedback, they were a source of hope; I am confident that they will “pay it forward”. So, I also thank them in advance for what they will do.

I am grateful to Purdue University and the Study in a Second Discipline program offered by the Provost’s Office at Purdue. This support enabled me to take public policy and welfare economics classes that shaped my thinking in substantive ways. I am grateful to the College of Technology at Purdue University for allowing me the time and support to explore critical interfaces of technology and society.

I owe a unique thanks to Eugene Spafford and my other colleagues at the Center for Education and Research in Information Assurance and Security (CERIAS) at Purdue University. CERIAS is a vibrant and committed research and education center that is unique in its multidisciplinary approach to information assurance and security, ranging from purely technical issues (e.g., intrusion detection, network security, etc) to ethical, legal, educational, communicational, linguistic, and economic issues, and the subtle interactions and dependencies among them. I consider joining CERIAS in 2000 as one of the best (and luckiest) decisions I have made in my career.

I am also grateful for the partial support that I received for this book from the National Science Foundation program for Ethics Education in Science and Engineering and for the time and energy provided by my collaborators on this grant: Mario Garcia, Nathan Harter, and Linda Morales. This grant helped support meetings and workshops that provided invaluable input into the book.

Finally, thank you to the following colleagues who enthusiastically participated in a workshop deliberating the contents of this book, preparing to pilot test these materials, and helping write the discussion questions at the end of each chapter. These questions were the collective output of rich discussion among the following individuals (with some input from the chapter authors): Krishani Abeysekera, Jim Chen, John Chen, Barbara Endicott-Popovsky, Rosemary Fernholz, Mario Garcia, Hossain Heydari, Ming Ivory, Connie Justice, Michael Losavio, Linda Morales, Onook Oh, Sharon Perkins Hall, and Hal Sudborough.
