In January 2010, when I was invited by IGI Global to edit a book in the data mining area, I realized that the thought of editing a book on XML data mining was appealing and daunting at the same time, due to the wide range of problems and topics that have been addressed in the past years. Hence I decided to face the challenge of creating a multi-authored book that captured the collective expertise of researchers in the field. Therefore, my first thank-you goes to the authors who welcomed and contributed to this project, trying their best to fulfill the organizational and content guidelines that I provided in advance for the various parts of the book and, in most cases, for the individual chapters.

I am very grateful to the external reviewers, who carefully scrutinized the assigned chapters and made many valuable suggestions for improvements.

My special thanks are for the editorial advisory board members, who kindly supported me through the editing process, especially in reviewing the chapter proposals and handling submission cases where conflicting reviews occurred.

I am also grateful to Mohammed J. Zaki, who wrote the foreword of this book. It was like receiving an unexpected and invaluable gift.

I wish to thank Mike Killian, who has been my assistant development editor at IGI Global. He has been everything I could hope for. I also wish to thank Salvatore Romeo, whose careful reading of the references led to a number of corrections and improvements.

This book is dedicated to my wife, Monica, for tolerating the editing process (I promise her not to take on new grand projects, at least not immediately), and to my son, Alessandro G., my very pride and joy.
