Acknowledgment

Putting together this book would not have been possible without the assistance and cooperation of many academics, practitioners, freelancers and other people whose insights proved highly valuable and beneficial for our project. First of all, I would like to thank the authors for submitting their contributions and their assistance during the process. Most of the authors also served as referees for the chapters. I want to express my gratitude to those who provided critical, constructive and comprehensive reviews. In particular, I want to thank Dr. Dimitris Kanellopoulos from University of Patras, Prof. El Hassan Bezzazi from University de Lille 2, Prof. Judit Olah from University of Wyoming, Dr Brane Semolic from University of Maribor, Dr. rer. nat. Claus-Peter Rueckemann from University in Hannover, Prof. Chiang Lichun from National Cheng Kung University, Prof. Adriana Schiopoiu Burlea from University of Craiova, Ole Axvig from Environmental Services Cheyenne, Wyoming, Dr. Vassiliki Andronikou from National Technical University of Athens, and Prof. Michael Mackert from the University of Texas at Austin.

I’m the beneficiary of wise counsel from others as well: special thanks go to Prof. Bo Sundgren, senior adviser to the Director General of Statistics Sweden and professor of Informatics at Mid Sweden University, Prof. Wita Wojtkowski from the College of Business and Economics at Boise State University and Prof. Henry Linger from the School of Information Management and Systems at Monash University in Australia for reading the chapters and providing intelligent suggestions.

I would also like also to thank the team at IGI Global, in particular to Jan Travers, Kristin M. Klinger, Rebecca Beistline, and Christine Bufton for their tolerance and patience, for their invaluable support and advice without which the book would have remained just a good idea.

It should be added that the publication of this volume does not mean the end of our work. Many ideas were proposed for further chapters, many concepts have yet to be properly nailed down, and many issues need to be further explored.

Our thinking developed considerably through the discussions and debates. We hope this publication is a way of launching the continuing discussion in a wider field.

Organizational Informatics has a vital role to play in the post-industrial agency, which has information as its key resource. At present we have well-developed disciplines concerned with the hard and soft extremes of the information fields.

Thank you.
