Acknowledgment

In academic publishing, the differences between proprietary publishing and open-source are negligible for the editors and writers, who earn quite nominal sums in terms of royalties, in most cases. Still, I wondered if the culture of open-source may sometimes be antithetical to proprietary publishing, which may have explained some of the challenges in soliciting work—beyond the typical difficulties of asking others to invest so much effort into the research and writing. This manuscript went past deadline by about half a year. I hope that this final manuscript has made the extra wait worth it.

The authors of this text contributed fresh insights in their chapters. They persisted through a long editorial process. They peer-reviewed each other’s works and responded with discernment and candor. I am thankful for each of their chapters. Steven Saltzberg of SoftChalk, LLC, enabled the inclusion of Sue Polysen Evan’s sidebar on the SoftChalk Cloud repository. I am deeply grateful for his excellent work in facilitating that.

I am grateful to the advisory committee who served as volunteers for this publishing effort, with no compensation. Each contributed some helpful work reaching out to potential contributors, and several even put their shoulders into the effort and wrote well-received chapters. I am thankful for their discipline to enable them to come through every time. Dr. Rosemary Talab offered fresh critiques and insights on several chapters.

A hearty thanks goes to the editorial board (who are listed in alphabetical order). They generously lent use of their professional names and credibility to this project. Many also provided excellent editorial feedback on the chapter drafts for the respective authors. Others even put in the hard work to write full chapters (that also went through double-blind editorial peer review).

The many excellent folks at IGI Global kept this project on track. In particular, Hannah Abelbeck provided some much-needed informational support at a critical period and helped shepherd this project to completion. She offered flexibility and direction at critical moments. I am glad that this publisher takes chances with the projects they support, and they offer plenty of editorial support and direction. Without them, Open-Source Technologies for Maximizing the Creation, Deployment and Use of Digital Resources and Information would not see the light of publishing day.
