Eleonora Bilotta is a full professor of General Psychology at the Department of Linguistics, Faculty of Humanities, University of Calabria, Italy, where she is the coordinator of the Ph.D Course in Psychology of Programming and Artificial Intelligence. Her research interests cover a broad range of topics including Cognitive Psychology and Intelligent systems in Education, Animal and Human Behaviour, Human Computer Interaction, Psychology of Music, Continuous and Discrete Dynamical Systems, and Artificial Life and Complexity. Eleonora Bilotta has published more than 250 scientific papers and is co-author of several books, among which, “A Gallery of Chua Attractors”, published in 2008 by World Scientific Publishing. Images from Eleonora Bilotta’s papers have been used as covers for the journals “Complexity” and the “International Journal of Bifurcation and Chaos. She is currently co-director of the Evolutionary systems Group (ESG) at the University of Calabria. She is co-author of a patent for a sound synthesizer exploiting chaotic dynamics.

Pietro Pantano is a Full Professor of Mathematical Physics at the Faculty of Engineering of the University of Calabria. His research interests are multidisciplinary, covering several different areas of research. These include Theory of Complexity and self-Organizing Systems, Discrete and Continuous Dynamical Systems, Chua’s oscillator, Biological Models based on Cellular Automata, Artificial Life, and Generative and Evolutionary Music. Prof. Pantano has published more than 300 scientific papers and has co-authored several books. These include “Ray methods for nonlinear waves in fluids and plasmas” published in 1993 by Longman Scientific and “A Gallery of Chua Attractors” published in 2008 by World Scientific Publishing. Images from papers co-authored by Prof. Pantano have been used as covers for the journals “Complexity” and the “International Journal of Bifurcation and Chaos.”
Prof. Pantano is currently co-director of the Evolutionary systems Group (ESG) at the University of Calabria. He is co-author of a patent for a sound synthesizer exploiting chaotic dynamics.
