

# Acknowledgments

There are a number of people that have supported me personally and professionally in my research over the years, and particularly while writing this book.

I want to dedicate this volume to Dr. Georgi Stojanov, a friend and mentor. When I was starting my research, he taught me what research was all about. It is not an understatement to say that most of what I know now about the research process has come from the long nights working together with him at the empty building of the Faculty of Electrical Engineering of the SS Cyril and Methodius University in Skopje, Macedonia. I am honored that he contributed the Foreword to this volume.

Teams are important in research, especially teams that *click* together. Dr. Samuel G. Collins, from the Department of Anthropology, Sociology and Criminal Justice at Towson University certainly makes a great collaborator. The ideas of future work elaborated in the last chapter have come up after numerous fruitful discussions with him. He is the author of Chapter IX, where he focuses on issues of emergence in multi-agent societies.

Dr. David B. Newlin from the Research Triangle Institute International, the Baltimore, MD office, patiently explained concepts from psychology to me—a computer scientist by training. He authored Appendix B, where he gives us some insights on the motivation systems in humans.

Many of my undergraduate, graduate, and doctoral students have directly and indirectly been involved in the work covered in this book. They are individually acknowledged at the end of each chapter, where applicable.

Working with undergraduate students has been a special challenge and privilege for me. The National Science Foundation's Research Experience for Undergraduates program has been instrumental in involving undergraduates from

all over the U.S. in research ventures. Two chapters in this book are a result of collaboration with these bright young students: Chapters VIII and XIV.

The Towson University's Jess and Mildred Fisher College of the Sciences and Mathematics Undergraduate Research Committee supported the research projects of many of the undergraduate students that were working with me on the robotics projects. The Department of Computer and Information Sciences at Towson was housing me and my lab (The Cognitive Agency and Robotics Laboratory) while I was working on this book.

The work on this book has been funded in part by the National Academies of Sciences under the Twinning Program supported by contract no. INT-0002341 from the National Science Foundation. The contents of this publication do not necessarily reflect the views or policies of the National Academies of Sciences or the National Science Foundation, nor does mention of trade names, commercial products, or organizations imply endorsement by the National Academies of Sciences or the National Science Foundation.

The quality of this book has been significantly improved by the constructive suggestions of the anonymous reviewers.

A further special note of thanks goes also to all the staff at Idea Group Inc., whose contributions and support throughout the whole process from inception of the initial idea to final publication have been invaluable.

And finally, I want to thank my family for their encouragement and love.
