Chapter 3.37
Mobile Commerce Multimedia Messaging Peer

INTRODUCTION

In a mobile-commerce world, shops could provide product brochures, cards, sounds, songs and so forth in the form of multimedia messaging presentations, which could be used by a customer to send to friends. Shopping malls will have information kiosks equipped with wireless access capabilities, and could perform searches across the mall’s network to update its multimedia message repository. Customers can download and distribute to their friends such multimedia content via mobile messaging, leading to increased revenue for the shops.

Over the years, mobile messaging has become an essential means of communication, and it is going to be even more so with the merging of the Internet and Mobile Networks. The ability to message from a phone to a computer on the Internet and vice versa is making messaging a powerful means of communication (Yeo, Hui, Soon, & Lau, 2001).

This article discusses the development of a multimedia messaging client for a personal digital assistant (PDA) and a Kiosk providing multimedia messages composition, search, share and send capabilities. Various messaging technologies, enabling wireless technologies and the peer-to-peer model, are also discussed and evaluated in this article. We substantiate the ideas discussed in this article with a description of an MMS PDA client application using JXTA with specific references to a shopping mall scenario.

BACKGROUND

Short Messaging Service

Text messaging uses the short messaging service (SMS, 100-200 characters in length), and involves
sending text messages between phones. Examples include “C U L8ER” and “OK. AT FLAT OR OFFICE.” It is quick and dirty, hard to use the keypad, abrupt, punctuation challenged and incredibly useful and popular. Text messaging also has a lot of advantages, such as its convenience, availability on all phones and discreteness.

Text messaging is most prevalent in the youth market (Tan, Hui, & Lau, 2001), and especially teenagers, who are able to manipulate the difficulty of entering text with the mobile phone keypad. In fact, it is suspected that this steep learning curve and the necessary insider knowledge are two of the things that appeal to the youngsters (Bennett & Weill, 1997).

Multimedia Messaging Service

The multimedia messaging service (MMS), as its name suggests, is the ability to send and receive messages comprising of a combination of text, sounds, images and video to MMS-capable handsets (MMS Architecture, 2002). The trends for the growth in MMS are taking place at all levels within GSM (Patel & Gaffney, 1997), enabling technologies such as GPRS, EDGE, 3G, Bluetooth and Wireless Access Protocol (WAP).

MMS, according to the 3GPP standards, is “a new service, which has no direct equivalent in the previous ETSI/GSM world or in the fixed network world.” Here is an introduction to the features of this innovative new service:

- MMS is a service environment that allows different kinds of services to be offered, especially those that can exploit different media, multimedia and multiple media.
- MMS will enable messages to be sent and received using lots of different media, including text, images, audio and video.
- As more advanced media become available, more content-rich applications and services can be offered using the MMS service environment without any changes.
