Chapter 2

Structural Influences on Global E-Commerce Activity

M. Lynne Markus

Christina Soh
Nanyang Technological University, Singapore

An important line of research on global information management examines the effects of national culture on IT development, operations, management and use. This paper argues that global information management researchers should not lose sight of structural conditions related to business-to-business and business-to-consumer e-commerce activity. Structural conditions are physical, social and economic arrangements that shape e-commerce business models and influence individual and organizational use of the Internet. Examples include geography (which affects the physical distribution of goods purchased online), space (which influences the choice of access technology for e-commerce) and financial infrastructure (which is related to credit card use). Structural conditions differ from country to country—and even from location to location within country, but they are not necessarily related to dimensions of natural culture. Therefore, valid explanations of global differences in e-commerce activity require a careful assessment of relevant structural factors.

INTRODUCTION

IS research interest in the global aspects of IT use is growing, partly owing to the efforts of publications like *JGIM*. A popular type of study examines the effect of national culture on IT development, operations, management and use (Gallupe

and Tan, 1999), where national culture is frequently understood in terms of Hofstede’s (1983, 1991) concepts and operationalizations (Davison, 1996).

This essay reminds the IS community not to neglect the structural conditions (Orlikowski, 1992; Markus and Benjamin, 1997) within which IT use occurs. Structural conditions are physical, social, and economic arrangements that shape e-commerce business models and influence individual and organizational use of the Internet. Examples include geography (which affects the physical distribution of goods purchased online), space (which influences the choice of access technology for e-commerce) and financial infrastructure (which is related to credit card use). Structural conditions differ from country to country—and even from location to location within a country—but they are not necessarily related to dimensions of natural culture. Therefore, analysis of cultural differences alone is unlikely to provide a satisfactory explanation of global differences in e-commerce activity. Valid explanations of global differences require a careful assessment of relevant structural, as well as cultural, factors.

To make this point, we examine a few of the structural conditions likely to influence e-commerce activity that are significantly different in various parts of Asia than they are in the U.S.A. The next two sections of the paper describe structural conditions related to business-to-consumer and business-to-business electronic commerce activity. The discussion section identifies implications for future research.

BUSINESS-TO-CONSUMER ELECTRONIC COMMERCE

In this section, we address the adoption of B2C e-commerce by individuals and the development of B2C e-commerce business models by firms.

Structural Factors in Individual B2C e-Commerce Adoption

One structural factor likely to affect IT adoption and e-readiness is the urban-rural distribution of a country’s population. People in rural districts generally have lower levels of access to the IT infrastructure necessary to sustain ordering over the Web; long distances may make “delivery to order” difficult, if not impossible. In North America urban dwellers comprise 77% of the population; in Asia as a whole the figure is 37% (United Nations Population Division, 1998). But within Asia, there are huge differences. The percent urban is 100% in Singapore, 95% in Hong Kong, 81% in South Korea, 78% in Japan, 54% in Malaysia, 30% in China, 27% in India, and 20% in Thailand (http://www.xist.org/global/urban.htm). It is not surprising therefore that the latest Economist Intelligence Unit’s survey ranks largely urban
