Chapter 1
Does Technology Uptake Convert to Effectiveness: Re-Evaluating E-Learning Effectiveness

Monika Mital
Jaipuria Institute of Management Lucknow, India

ABSTRACT
In this paper, the author focuses on learner perceptions of the characteristics of learning technology as explanatory variables for acceptance behavior. The author presents an empirical study examining the effects of these perceptions on two outcomes: uptake of an e-learning technology and effectiveness of such technologies that results in the intention to continue to use. The effectiveness of e-learning programs are dependent on the fulfillment of the leaner expectations in terms of the suitability of the learning to the present task, applicability of the learning, and the right incentives and measures to encourage and motivate employees.

INTRODUCTION
Technological advances are dramatically altering the training and development landscape in India. Although the adoption of online learning programs by Indian organizations has been significant in recent years, the capabilities and efficacy of such programs have yet to be fully investigated.

Most effort in this area has been devoted to program development while examinations of online program quality and effectiveness have been merely implied. With little empirical knowledge about Internet-based learning outcomes, the need for research in this area is not only timely, but also imperative.

In this study, we adopt the cognitive perspective of e-learning and the word e-learning has been used synonymously with e-training. E-learning
is the use of information and communication technologies to deliver information and instruction to learners as part of planned efforts to increase knowledge and skill. Organizations are choosing e-learning as a mode of imparting learning so as to increase learner convenience, reduce cost of delivery of learning, track and monitor learning needs of employees and customize learning programs for them. E-learning appeals to organizations that have a strong need to deliver consistent training across multiple locations. While the potential advantages of e-learning make it appealing, organizations embarking on e-learning implementations must keep in mind that successful implementation requires significant planning and effort. E-learning initiatives can require considerable investment in both information technology (IT) and staff. Specific costs include development costs to design and build the actual courses as well as hardware and software costs to allow users to access the training.

According to the Technology Acceptance Model (TAM) by Davis, Bagozzi, & Warshaw (1989), employee attitudes toward computers must be investigated since the intention of computer use and actual use are influenced by such attitudes. Employees have various backgrounds, computer skills, beliefs, and interests and such differences cause different perceptions toward e-learning and its effectiveness (Hiltz, 1994). Factors such as age, gender, personality, and computer experience have proven to be determinants of computer attitudes (e.g., Hunt & Bohlin, 1993; Miller & Varma, 1994; Raub, 1981; Reece & Gable, 1982; Taylor & Todd, 1995; Sanchez et al., 2006). Previous researches have suggested and proved that the effectiveness of e-learning programs is dependent upon three sets of antecedent factors: Technology factors (Parasuraman, 2000; Masie, 2001; Brown, 2001, 2002); Psychological factors (Henning, 2003; Martin et al., 2003); Organizational factors (Guest, 1998; Herriot et al., 1998; Martin et al., 1998; Capelli, 1998; Martin & Beaumont, 2003).

The technology factors include: whether the employees have access to the requisite infrastructure? Are they trained to use technology? Is the training design to their satisfaction?

The psychological factors include: whether the employees are motivated enough to undergo e-learning? Are they confident of their technology skills? Does e-learning fit their personal learning style?

The Organizational factors include: Does the organization value learning and knowledge acquisition? Is their learning applicable in real work life situations? Does the culture in the organization encourage personal enhancement and self-development?

Also it has been found that the effectiveness of any information technology application is often obstructed by the user’s unwillingness to accept and use such applications (Bowen, 1986; Young, 1984).

Although intention to use and actual use have been studied by a number of researchers but whether the actual use results in positive learning outcomes in terms of perceptions about effectiveness is yet to be researched. The study tries to fill in this gap.

LITERATURE REVIEW

Thomas, Compeau and Higgins (2006) provided an integrative model explaining intentions to use an Information Technology application. They explained that user intentions vary based on user attitudes, user characteristics and should match with user development and user expectations. Chau and Lai (2003) proposed that customization of training content and flexibility to adjust the program according to user requirements can lead to perceived usefulness and as a result to user acceptance of information technology. According to Dringus (2000) the main motive behind user acceptance is self development and the usefulness of a particular technology which to a large extent explains what Dobbs(2000) proposed that customization of content according to user el-
