ABSTRACT

This chapter examines the existence of regional agglomerations of manufacturing, service and creative industries, and the relationship between these industries and the wealth of regions. Through an analysis of 250 European regions, three important conclusions can be inferred from the results obtained in this chapter. The first is that creative industries play an important role in the wealth of the regions. The second is that the most creative regions are characterized by having more high-tech manufacturing industries than the rest of the regions, although the number of low-tech manufacturing firms is similar. Lastly, in the richest regions, a greater share of high-tech manufacturing industries coexists with a greater share of creative industries. The importance of this chapter resides in the fact that up until now no analysis has demonstrated that creative industries are the most important industries in regional wealth.

1. INTRODUCTION

The localization of creative industries, as highlighted by the work of Stam et al. (2008), Cooke (2008), Lazzeretti et al. (2008), Capone (2008) and Power and Nielsen (2010), is an area of increasing importance in the literature on geographic agglomerations. These industries are in fact groupings of specific sectors of low-technology manufacturing and knowledge-intensive services, which is why their importance is related to the ever-increasing dependence of manufacturing sectors on service industries (Peneder et al., 2003; Pilat and Wölfl, DOI: 10.4018/978-1-4666-1945-6.ch091
in the richest regions a greater share of high-tech manufacturing industries coexists with a greater share of creative industries, thus showing the importance of creativity.

The outline that we have used in this paper is as follows: in Sections 2 we briefly summarize the recent basic theory on the study of maps of manufacturing, service and creative industry agglomerations to determine the localization patterns and the relationships they have on the aforementioned studies. In Section 3, we include the empirical study where we set out the variables used, the sources the data was extracted from and the methodology used for their study as well as the results obtained. Conclusions can be found in Section 4.

2. MAPS OF AGGLOMERATIONS IN MANUFACTURING, SERVICES AND CREATIVE INDUSTRIES

The maps of agglomerations in manufacturing, services and creative industries are representations of sectors which are located in a geographic zone, whether it is a city, region or country. Examples of these maps can be found in studies on the different terminologies used to name these agglomerations according to their characteristics: industrial districts, clusters, milieux and Local Production Systems. Therefore, we have maps of sectoral concentrations for most of the European countries (Becattini and Coltori, 2006; Crouch and Farrel, 2001; Pitelis and Pseiridis, 2006; Boix and Trullén, 2011).

Recently, the study of maps of clusters and districts has acquired a new dimension, in which instead of limiting the localization of the different industries and services at separate levels, the maps are more aggregated. Examples of the former can be found in the studies carried out by Becattini and Coltori (2006), who point out the different industrial districts in Italy – the shoe industry located in Brenta, Fermano Maceratese...
