Open Collectivism and Knowledge Communities in Japan

Hideo Yamazaki

INTRODUCTION

The aim of this article is to introduce an Eastern CoPs’ specific approach that is quite different from that of Western communities. In a collectivist prevalent societal type, the “sharing of feelings should come first, naturally followed by knowledge sharing” type of approach works very well even in a business environment.

One of Japan’s traditional manufacturers has launched several interesting knowledge communities that are different from the accepted Western KM approach that emphasizes cost and effect straightforwardly. Their approach emphasized the generation of social networking on intranet first, and at a later stage, they proceeded to knowledge sharing through communities of practice.

This “go slow to go fast” approach may look like one of the typical and traditional Japanese management styles. However, in this approach, the culture of this company group steadily changes from introverted and closed to extroverted and open.

Their approach to build open and extroverted collectivism that is generated by knowledge communities could be one of the new management style prototypes of Japanese companies in the future.

BACKGROUND

QP Corporation is a top-class Japanese company, manufacturing and marketing mayonnaise and salad dressings in Japan. One of the group companies manufactures jam. QP is one of the top brands in the food industry. They have been in the food manufacturing business more than 80 years with 2,200 employees. The total number of employees including group companies is 6,000. This means that QP are typical of the traditional business group in Japan.

Their operation of knowledge communities has a 3.5-year history. In the past, their original KM approach failed when they built knowledge databases for knowledge sharing. This approach did not work well, let alone match the expectations of management. Therefore, this time, they decided against the mechanical approach such as building a knowledge database instead of building knowledge communities on their intranet was tried.

As far as the communities’ approaches toward face-to-face activity, traditional socializing approaches such as company outings, pub drinking, and factory participation in local festivals where employees socialize with local people work very well in this company. And small-group employee activities for incremental improvement also work well. Therefore, the main activities of the revised QP KM plan focused on building knowledge communities on their intranet. The purposes was to change the company culture from a closed and introverted one to an open and extroverted one; promote employees to knowledge workers who are individually treasured; and promote workers into those who produce and share business ideas.

In the past, one of the features of Japanese companies was an introverted collectivism that supports the production of a quality product. However, in the 21st century of rapidly changing market environments, companies need fresh idea generation for new products and for new marketing, and it is clear that fresh ideas cannot emerge only between intimate colleagues. New ideas can come from anybody else inside and outside of organizations. Knowledge communities supply companies with “the strength of weak ties”, backed by social networking that bridges silo type organizations.
