Issues in Implementing Online Education in a Developing Country

Tim Bristol
Crown College, USA

INTRODUCTION

This article highlights the issues that may arise when implementing online education in a developing country. In 2005, Faculté des Sciences Infirmières (FSIL) opened in Leogane, Haiti. The mission of this school is to provide nursing professionals for the country of Haiti, especially the southern half of the country. This facility was built with funds from the United States Agency for International Development (USAID) and is managed by the l’Université Episcopale d’Haïti. The school maintains a curricular format similar to that of baccalaureate nursing programs in the U.S.

Haiti is in great need of health care professionals. In Haiti, there are 11 nurses per 100,000 population. In the U.S. this ratio is 770 per 100,000. Given that infant mortality is 10 times worse than that in the U.S. and that the lifespan is 15-20 years less, the need for qualified health care professionals is overwhelming.

Even though the income of FSIL is 1/3 what is actually needed, the school has managed to keep enrolling students and maintaining the facility. They have also managed to maintain a computer lab with 13 computers and a stable satellite Internet connection. The author visited the campus in July of 2007. The purpose of this initial visit was to evaluate the information technology structure and the capabilities of the staff and students to determine what if any connections could be made between American nursing programs and FSIL. A SWOT analysis was conducted to assess internal strengths and weaknesses for FSIL as well as external Opportunities and Threats related to using E-learning to enhance FSIL.

BACKGROUND

Internet communication has become the essential technology for connecting learners and educators across the globe. This is important because internationally over 2 million students study abroad. Having an internationally diverse student body is important to consider because approximately 50% of students reside in countries that do not have the educational infrastructure to meet the needs of their populations (Scarafiotti & Cleveland-Innes, 2006). The need for distance education is in developing countries is critical.

Fortunately, the need for distance education in developing countries can be met with a tool with proven efficacy. In nursing education online learning has demonstrated effectiveness in enhancing critical thinking and professional socialization (Daroszewski, Kinser, & Lloyd, 2004; Nesler, Hannen, & Melburg, 2001; O’Neil, Fisher, & Newbold, 2004). In overall outcomes, the “no significant difference” phenomenon demonstrates that outcomes in the face-to-face classroom are no different than those realized in the online classroom (Vroeginday, 2005). These facts point to the very real possibility of successfully assisting developing countries by providing healthcare education through the power of online distance education (Marin, 2006).

SWOT ANALYSIS OF A THIRD WORLD NURSING INSTITUTION

A nurse educator and e-learning consultant partnered with the Dean of Nursing at a baccalaureate nursing program in Leogane, Haiti. Together they analyzed the school’s assets and liabilities to develop the following SWOT analysis.

Strengths

Strengths revealed in the assessment lay in the willingness of the dean to pursue this relationship. Moving from a face-to-face lecture-based environment to an online environment is a challenge for any academic program. To do this in an already stressed system requires commitment on the part of all involved. Another strength is
