ABSTRACT

The need to effectively manage IT resources such that they enhance the business value of firms makes IT Governance (ITG) an important issue for both IS researchers and practitioners. The purpose of this paper is to build a conceptual framework for ITG in small and Medium-Sized Enterprises (SMEs). The authors first analyze the main theories applied in ITG research, and confront them with the specificities of SMEs. The authors then highlight the limits of those theories in SMEs context and discuss adaptations needed or alternative theories in such context. The resulting framework is then applied to generate a set of six research propositions on ITG in SMEs.

1. INTRODUCTION

Given that some organizations achieve higher performance with their IT investments while others fail to do so (Gattiker & Goodhue, 2004), the issue that matters now is to know under which conditions organizations create value from their IT (Kohli & Grover, 2008).

It has been argued that IT governance (ITG), which “is about controlling the strategic impact of IT and its value delivery to the business” (Zarvić et al., 2012, p. 543) can make the difference (Nfuka, & Rusu, 2011; Devos, et al., 2012; Wilkin, 2012). The need to effectively manage IT resources so that they can enhance the business value of firms makes of ITG an important issue and yet an uneasy task (Weill & Ross, 2004; Van Grembergen & De Haes, 2010). Indeed, the most important IT challenges faced by organizations now and in the future are less related to technology than to governance (Nfuka, & Rusu, 2011).

The literature related to ITG in particular, and to corporate governance (CG) in general, has mobilized and proposed different theories and frameworks to explain the mechanisms of governance. However, most of those theories and frameworks are often criticized as being more appropriate for large enterprises (LEs) and less for small and medium-sized enterprises (SMEs), hence the call for revisiting existing theories and frameworks or for proposing alternative ones with in mind the specific realities of SMEs (Banham & He, 2010). This call is important, all the more so that studies on ITG in SMEs are rather rare (Vogt et al., 2011; Alves et al., 2013). This paucity of studies does not mean, however, that ITG does not exist in the context of SMEs. Previous studies have shown that SMEs use IT in their basic activities and are expanding IT usage in more advanced processes (Raymond & Croteau, 2006; Mardikyan, 2010; Ruivo, Oliveira & Neto, 2012; Sila & Dobni, 2012). As IT users, SMEs have to find ways to allocate IT-related responsibilities and to ensure IT-business alignment for increased business value, brief ways to practice ITG (Luftman et al., 2010). Given the important consequences IT can have on growth and survival of SMEs in a competitive market, we argue that ITG for SMEs is a necessity and must be researched.

The purpose of this theoretical study is to develop a framework for research on IT governance in SMEs. To do so, we proceed in three phases. First, we analyze theories generally applied in ITG literature with in mind the specificities of SMEs, and we bring out salient limits of these theories with regards to the realities of SMEs. Second, we identify adaptations necessary to these theories to account for the SME’s realities, and alternative theories better suited to its context. Third, building on the results of the precedent analysis we propose a conceptual framework for ITG in SMEs and related propositions that can be used as hypotheses for future research.
