Chapter 10
An Extended Study on Training and Physical Exercise in Esports

ABSTRACT

This chapter is an extended revision of the authors’ earlier study (2016) on the training routines of professional and high-level esport players, with added focus on their physical exercise. The study is methodologically mixed with a quantitative survey sample (n=115) and a qualitative interview sample (n=7). Based on this data, high-level esport players train approximately 5.28 hours every day around the year, and professional esport players at least the same amount. Approximately 1.08 hours of that training is physical exercise. More than half (55.6%) of the professional and high-level esport players believe that integrating physical exercise into their training programs has a positive effect on esport performance; however, no less than 47.0% do the physical exercise chiefly to maintain their overall state of health. Accordingly, the study indicates that professional and high-level esport players are physically active as well: those of age 18 and older exercising more than three times the daily 21-minute physical activity recommendation given by the World Health Organization.

INTRODUCTION

Esports have recently become a significant part of our sports cultures. A number of journalists, policy-makers, and academics have thus ended up conceptualizing the cultural identity of the phenomenon: what are the relations between esports and sports, e-athletes and athletes, and esport play and physical exercise (see Taylor, 2012; Ferrari, 2013; von Hilvoorde, 2016; Freeman & Wohn, 2017; Karhulahti, 2017; Jenny et al., 2017; Kane & Spradley, 2017), furthermore, what are the related socio-cultural implications and what makes esport engagement rewarding to begin with? (See Lee & Schoenstedt, 2011; Witkowski, 2012a; Harper, 2013; Martončík, 2015; Nielsen & Karhulahti 2017; Hamari & Sjöblom, 2017; Hallman & Giel, 2017; Siutila & Havaste, 2018.)

This study is not explicitly concerned with the above questions but brings them into a new light. Namely, in what follows, we explore the training routines of professional and high-level esport players with added focus on their physical exercise. This paper is an extended revision of our earlier work (Kari & Karhulahti, 2016), enhanced by supplementary data and insights via qualitative interviews of five professional esport players.

The solitary earlier academic contribution that we were able to find on the topic comes from Andreas Hebbel-Seeger (2012). He quotes a study from esport organization ESL (Electronic Sports League) that apparently issued an unpublished German thesis written by Lüttmann (first name unobtainable) in 2007. According to Hebbel-Seeger (2012), the study claimed that esport players are more active in sports than the average population, with no less than 95% of them exercising traditional sports as well.

Since we have not been able to acquire the referenced study (which appears to be unpublished, non-peer-reviewed, and in German) we take its results with a grain of salt. For instance, it is not clear whether the study concerned professional players, high-level players, amateurs, or fans. Hence, for the present study, a priori hypotheses are not proposed. Training, physical exercise, and players’ perceptions will be examined at a descriptive level without utilizing any prior theoretical framework.

METHODOLOGY

The quantitative part of the study leans on a data set that we gathered with an online survey between September 2015 and June 2016. The survey was created with the LimeSurvey 2.05+ software. We pre-tested it quantitatively with ten and qualitatively with four scholars from the fields of play research, videogame research, information
