ABSTRACT

Cloud computing is not associated with a specific technology, instead it as an alternative method to deliver technology as a service. This article investigates current cloud computing adoption in the United States (USA) and United Kingdom (UK) hedge fund industry. Hedge fund technologists, prime service consultants, technology service providers, industry application vendors, investors and an independent information security consultant participated were surveyed for this article. The article acknowledges the growth of cloud computing in the hedge fund sector. This research work also highlights that the private cloud definition is vague and requires further classification, elaborating on the variants of private cloud. This is important as the variants of private cloud computing offer varying benefits and risk which the hedge fund sector has proven to be sensitive. Equally, this article argues that some of the current security concerns are over-stated and perhaps reflect a conservative decision making framework rather than a realistic consideration of the options.

KEYWORDS

Cloud Computing, Hedge Funding, Software-As-A-Service, Technology Service Providers

1. INTRODUCTION

Cloud Computing is being adopted versatile manner by the different industries in the context of both in the private and public sectors. (Mell & Grance, 2011) defined various service models of cloud computing as Software as a Service, Platform as a Service and Infrastructure as a Service, which are luring the companies due to their benefits. Cloud computing is capable of reaping benefits of on-demand self-service, broad network access, resource pooling, rapid elasticity and measured service (Amin, 2013). Cloud computing offers alternative IT solutions to cut down the cost of IT infrastructure (Aljabre, 2012). The hedge fund industry is no exception and facing the pressure of to cut down the management fees charged to investors (Jones, 2013). Despite this lure, there are constraints to adopt the cloud computing specifically the public cloud deployment model in the context of control and ownership of portfolio data by the fund (Amin, 2013). The recognizing the requirements of each functional area and delivering them in customization manner depends upon the complexity work process and ease of use demanded by the end-users (Ziman, 2012), as each functional area differs in ease of use and complexity. Two pragmatic drawbacks are security and privacy and loss of governance and control (Susanto, Almunawar et al., 2012). (AlZain, Soh et al., 2013) also support the security is a major concern in the cloud computing.

DOI: 10.4018/JCIT.2019070101
A hedge fund’s portfolio is a main portion of intellectual property. If security and or privacy were compromised the consequences could be catastrophic, just like happened in May 2017 the ransomware attacks affect the worldwide. This implies there is a need for careful thought of the picky options and approaches offered by the cloud computing concept and its application to the operation of hedge funds. Hedge funds are affected by extensive business constraints, particularly in IT operations need to cut down the costs and cloud computing emerge as right; though concerns are constraining adoption. The paper highlights the constraints and improvements which could fuel cloud adoption in hedge funding industry. In this research work various types cloud service and deployment models were studied. The advantages and disadvantages of cloud computing recognized in general. A survey was conducted in applications of cloud computing within the hedge fund industry concentrated on USA and UK based organizations. Determine the cause of adoption and rejection of cloud computing within hedge fund industry. Also, recommendations were made to ease the transition and improvement in adopting the cloud computing within hedge fund industry.

Further the scheme of research paper as follows: Section 2 deals with background and literature where the review concepts of cloud computing, its risks and benefits and challenges present within the hedge fund sector. Section 3 covers the problem formulation, surveying approaches, tools and processes adopted to ensure a thorough survey was conducted. Section 4 begins with reviewing the actual survey method exercised and then presents the results from the various surveys. Section 5 applies critical analysis to the results, identifies key findings and offers ideas for improvements. Finally, the paper concludes by incorporating lessons learned and critically reviewing the complete study and recommendations for improvements and future work.

2. BACKGROUND

The National Institute of Standards and Technology offers an overview of cloud computing as:

“Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction” (Mell & Grance, 2011) Exponential growth for cloud computing is widely predicted by leading industry vendors and consultants. (CISCO 2018) Cisco’s Cloud Index forecasts that total data center storage capacity will grow nearly 4-fold from 2016 to 2021, growing from 663 EB in 2016 to 2.6 ZB by 2021. IDG research estimates “over the 2012–2016 forecast periods, public IT cloud services will enjoy a compound annual growth rate (CAGR) of 26.4%” (Framingham, 2011). The Federal Cloud Strategy publication highlights cloud adoption to be a feasible solution to these challenges and usher’s agencies towards cloud offerings. “The cloud computing model can significantly help agencies grappling with the need to provide highly reliable, innovative services quickly despite resource constraints” (Kundra, 2011). In summary it is possible to identify five characteristics of cloud computing as; on-demand self-service, broad network access, resource pooling, rapid elasticity and measured serviced. An alternative taxonomy is to segment the cloud model using the NIST definition into service and deployment models (Mell & Grance, 2011). This paper explores the adoption of cloud computing within the hedge fund business sector. Hedge funds face their own unique challenges, which cloud computing has the potential to address. “The twin pressures of fee compression from investors and increasing regulatory oversight has meant many hedge fund managers may no longer have the appetite for incurring capital expenditures on building an in-house infrastructure…” (Amin, 2013).

2.1. Literature Review

(Kim and Jo, 2017) according to this research paper cloud computing is capable enough to handle business demands quickly and economically. A hedge fund is an alternative investment organisation with a motive of positive absolute returns despite of market conditions achieved due to the ability of
