Chapter 14
Narrative Therapy to Address Trauma for Emergency Medical Services and Firefighters

ABSTRACT
First responders, including Emergency Medical Services personnel and firefighters, support community members in times of crisis. When responding to emergencies, first responders often experience both direct and vicarious trauma. Over time, the pace and intensity of a career as a first responder leads to poor health habits and high risk for mental health issues including posttraumatic stress disorder. Due to concern about peer perception and mental health stigma, these professionals are less likely to seek mental health supports to manage and process trauma. This chapter explores Narrative Therapy as an ideal option for mental health treatment of first responder trauma, providing a collaborative approach to therapy using the natural coping strategy of storytelling.

INTRODUCTION
First responders, including Emergency Medical Services (EMS) personnel and firefighters, have increased risk of mental health issues due to exposure to trauma over a career (Jones, 2017). More specifically, first responders have increased risk of mental illness symptoms including PTSD, depression, anxiety, sleep

DOI: 10.4018/978-1-5225-9803-9.ch014
issues, substance use, and suicidal ideation as compared to other helping professionals and the general public (Martin, Tran, & Buser, 2017). Risk for such symptoms increase for first responders located in rural areas, working longer shifts, and those without social supports at home (Jones, Nagel, McSweeney, Curran, 2018). Mental health supports, such as Employee Assistance Programs (EAPs) are critical for addressing the high risk for Posttraumatic Stress Disorder (PTSD) and suicide among first responders (Heightman, 2016). This chapter explores storytelling as a natural coping strategy for first responders, and proposes use of Narrative Therapy as means of trauma-informed mental health counseling for this population.

BACKGROUND

Emergency Medical Services (EMS) includes Emergency Medical Technicians (EMTs) and Paramedics. The scope of practice outlined by the National Highway Traffic Safety Administration defines the roles and training of EMS (USDOT, 2007). In this scope of practice, EMTs focus on basic life support (BLS) services which encompass treating and transporting stable patients not in imminent harm of death or disability. Beyond the training of EMTs, Paramedics represent the highest level of certification for EMS. Paramedics oversee the work of EMTs and direct firefighters on scene in the interest of prioritizing patient health outcomes. Paramedics perform invasive medical procedures for advanced life support (ALS) services addressing life-threatening emergencies during patient treatment and transport (USDOT, 2007). Nationally, 70% of EMS personnel are EMTs, and only 24% are Paramedics (USDHS, 2017).

EMS as a field is generally young. The Highway Safety Act of 1966 established the Department of Transportation (DOT; NHTSA, n.d). This marks early organization and development of the EMS system as represented today, with DOT tasked with regulation and implementation of training standards (NHTSA, 2011). Mainstream media representation of EMS dating back to the 1970s, primarily with the television show *Emergency*, began to create both public awareness of 911 services, as well as public misconceptions about emergency support in communities (NHTSA, n.d). EMS often work closely with, or cross train as firefighters. Nationally, 40% of EMS work directly with fire departments (NHTSA, 2011).

Early firefighters in the 1800s in the US were largely volunteers (Kenlon, 1913). Later, through central government regulation, firefighters established a fraternal order or “brotherhood” still recognized today in response to early rivalries between volunteer firefighting communities. In modern firefighting, the United States Fire Administration (USFA) trains, supports, and governs firefighters as a division of the Federal Emergency Management Agency (FEMA), first established in 1973 to address fire prevention (Kruger, 2018). Firefighters focus on fire prevention and response in the community (USDHS, 2017). Training for firefighters includes Firefighter I and Firefighter II certifications (NFPA, 2019). Both levels of certification include foundational training including response to alarms, tools and equipment for fire management, navigating environments safely to address fires, and helping rescue fire victims. The Firefighter II certification includes further skills training with a wider variety of equipment than Firefighter I.

Nationally, 71% of fire departments are staffed by volunteers, and as such, 56% of all firefighters in the US are volunteers (USDHS, 2017). While less common, 17 states also use volunteer EMS (USDOT, 2007). Volunteer first responders often receive no pay for their services or are paid per call (NVFC, 2014). While volunteers still experience camaraderie and the culture of first responders, they may experience this culture differently than career first responders. Further, volunteer first responders experience trauma and stress without as many supports and benefits. For example, it is rare for volunteer first responders...
