Chapter VI

A Multi-Level Performance Framework for Knowledge Management

Anne Massey, Indiana University, USA

V. Ramesh, Indiana University, USA

Mitzi Montoya-Weiss, North Carolina State University, USA

Abstract

Knowledge management (KM) has gained increasing attention since the mid-1990s. A KM strategy involves consciously helping people share and put knowledge into action. However, before an organization can realize the promise of KM, a fundamental question needs to be asked: What performance goal(s) is the organization trying to achieve? In this chapter, we develop and offer a multi-level framework that provides a view of the performance environment surrounding organizational knowledge work. We illustrate the KM framework using two organizational case studies. Then, based on the KM framework and further insights drawn from our case studies, we offer a series of steps that may guide and assist organizations and practitioners as they undertake KM initiatives. We further demonstrate the applicability of these steps by examining KM initiatives within a global software development company. We conclude with a discussion of implications for organizational practice and directions for future research.

Knowledge management (KM) is a topic that has gained increasing attention since the mid-1990s. Knowledge about customers, products, processes, and past successes and failures are assets that may produce long-term sustainable competitive advantage for organizations (Huber, 2001; Leonard & Sensiper, 1998; Stewart, 2001). KM proponents argue that these assets are as important as managing other organizational assets like labor and capital. A survey conducted by Knowledge Management magazine and the International Data Corporation suggests that KM is evolving from a discrete undertaking to a strategic component of business solutions (Dyer & McDonough, 2001).

A KM strategy entails consciously helping people share and put knowledge into action by creating access, context, infrastructure, and simultaneously shortening learning cycles (Alavi & Leidner, 2001; Davenport, DeLong, & Beers, 1998; Davenport & Prusak, 1998; O’Dell & Grayson, 1998). It takes place within a complex system of organizational structure and culture and often is enabled through information technology (IT) (Alavi, 2000; Alavi & Leidner, 2001). While technology drove the initial interest in KM, both academics and practitioners have begun to realize that effective KM initiatives and solutions require a broader understanding of knowledge work environment (Grover & Davenport, 2001; Holsapple & Joshi, 2002; Massey & Montoya-Weiss, 2002; Rubenstein-Montano et al., 2001). Specifically, before an organization can realize the promise of KM, a fundamental question needs to be asked: What performance goal(s) is the organization trying to achieve? Addressing this question will direct the organization to what knowledge should be managed and how it should be managed.

Improving customer service, shortening product development cycles, growing revenues, and improving profits commonly are cited as goals motivating KM initiatives. If the intent of a KM initiative is to enhance organizational performance, organizations first need to understand the performance environment surrounding and driving the underlying knowledge work. For example, improving customer service or shortening product development cycles requires that firms look to their processes, which may be reengineered to capitalize on or expand organizational knowledge resources and capabilities (Gold, Malhotra, & Segars, 2001; Hammer & Champy, 1993; Maier & Remus, 2001). Generating performance improvements via a KM initiative thus requires a deep understanding of how process work is organized, what knowledge is inherent to and derived from it, what factors influence knowledge workers, and how all of these factors relate to an organization’s business environment (Massey & Montoya-Weiss, 2002).

In this chapter, we offer a framework that provides a multi-level view of the performance environment surrounding organizational knowledge work. The framework provides a useful means by which to identify, define, analyze, and address knowledge-based problems or opportunities relative to multi-level (business, process, and knowledge worker) performance goals and requirements. Our perspective responds to a current call in the literature for KM frameworks that take a systems-oriented perspective by considering problems and opportunities in their entirety (Rubenstein-Montano et al., 2001; Senge, 1990). We draw from and integrate literature concerned with approaches to dealing with complexity and purposeful (i.e., performance-oriented) systems (Checkland & Howell, 1998), business process reengineering (Hammer & Champy, 1993), and human performance (Stolovich & Keeps, 1999).
