ABSTRACT

The potential of the Internet to both geographically expand customer bases and provide a source of growth has led to a rapid embrace of the Internet by a majority of small businesses in the United Kingdom. However, many studies suggest that much of this adoption takes the form of simple websites representing little more than an electronic brochure. This paper investigates the level of Small and Medium Enterprise (SME) website adoption and functionality and how this relates to growth aspirations, specifically the geographical expansion of customer bases. The possibility that IT skills shortages could explain the gap between the Internet’s potential and the extent of involvement by a vast majority of UK SMEs is explored.

Keywords: E-Commerce in SMEs, Organizational Growth, IT Competency, IT Education

INTRODUCTION

The increasing accessibility of the Internet has led to a massive increase in the level of e-commerce in the UK in recent years, with sales over the Internet rising from £3.2 billion in 2002 to 38.8 billion in 2007 (ONS, 2008). This is not just a reflection of customers becoming familiar and comfortable with accessing the websites of large established businesses within the UK, but also the increasing number of smaller businesses which have taken advantage of the potential of the Internet to cheaply advertise and sell their products to a wide range of customers (O’Keefe et al., 1998). As well as more traditional business models being augmented with the addition of a website there are new businesses reliant entirely on the Internet for their sales although many of these collapsed when the dot.com bubble burst in the early 2000s (Drew, 2003). Again Web

only activity has not just been restricted to the larger, now household names, such as Amazon. Relatively low fixed costs and perceived risk has led to an explosion of entrepreneurial activity by individuals often alongside other economic activity such as salaried employment (O’Keefe, et al., 1998). There is an extensive literature examining the possible determinants for firms choosing to develop websites which includes not only the opportunities created (Stockdale and Standing, 2004), but also the threats that Internet usage brings (Kleindl, 2000). Whatever the driving forces by the beginning of the present century the unavoidability of the Web meant that e-commerce in its broadest sense has become an imperative rather than an alternative (Wen et al., 2001).

Whilst a vast majority of firms have or will develop their own Web presences, there is a greater variation in the speed, depth and form that involvement will take (Wen et al., 2001). It has also been suggested that website development is a staged process often driven by the availability of resources, particularly knowledge (Levy and Powell, 2003; Rao et al., 2003; Lee, 2004). Not all researchers are convinced of the merit of simpler stages models given the existence of early adopters and heterogeneity of small businesses (Martin and Matlay, 2001; Alonso Mendo and Fitzgerald, 2005a).

This study concentrates on the functions included in the websites of UK SMEs, and how these different levels of functionality relate to the perceived benefits of the Internet in providing growth potential and in particular access to markets beyond their local core market (Lawson et al., 2003). This would mean that greater adoption of e-commerce would lead to higher sales growth (Raymond et al., 2005), even providing a relatively cheap method of internationalizing client bases (Kula and Tatoglu, 2003). These opportunities are particularly pertinent to SMEs who often may operate in niche markets, relying on a thinly but widely distributed customer base (Napier et al., 2001; Galloway et al., 2008). Whether, UK SMEs can fully take advantage of the opportunities open to them seems questionable given that their websites are often little more than product brochures (Levy and Powell, 2003; Crespi et al., 2004).

Given the potential of the Internet to not only grow the firm, but also to simply allow the firm to compete in a rapidly globalizing marketplace, it seems strange that studies have found little sign of true e-commerce adoption. One explanation comes from those studies examining the choice to adopt, which find a link to the perceived ease of use (Grandon and Pearson, 2004). Therefore potential skills shortages for owners/managers and their staff could clearly hold back greater functionality of websites (Mehrtens et al., 2001; Mirchandani and Motwani, 2001; Robertson et al., 2007).

When discussing the issues raised by UK SME website functionality analysis of data from the Federation of Small Business (FSB) ‘Lifting the Barriers to Growth’ survey is used to complement discussion of existing literature. The next section discusses studies that have examined the decision to adopt and develop a Web presence and what role growth plays in this decision. Since one of the main potentials for growth from the internet for SMEs is to break out of their traditional markets, attention is then turned to the possibility of geographical expansion and internationalization through website functions. The role IT skills shortages play in low website functionality is explored in the fourth section before considering future routes for research, and drawing conclusions in the last section.

**GROWTH, WEBSITE ADOPTION AND FUNCTIONALITY**

The latter part of the 20th century saw a reduced importance of large corporations in western economies in terms of output and employment, and a greater emphasis on small and medium enterprises (SMEs). Explanations proposed for the rapid resurgence of small business activity in the form of a ‘third industrial revolution’ (Audretsch and Thurik, 2001), are: emergence of new industries, such as software and biotechnology; deregulation and privatization of many
