Employee Behavioral Intentions in Adopting Information Technology: The Case of the Greek Hotel Industry

Anastasia A. Katou, University of Macedonia, Greece
Margarita A. Vogiatzi, Technical Educational Institute of Thessaloniki, Greece

ABSTRACT
This study investigates the impact of perceived information technology (IT) beliefs on behavioural intention to use IT. The study is based on a national sample of 18 organisations from the private hotel industry in Greece, and on data obtained from 215 employees. The statistical method employed is structural equation modelling. The findings of the study suggest that employee attitudes positively and fully mediate the relationship between perceived IT beliefs and behavioural intention to use IT. Furthermore, it suggests that this relationship is influenced by individual factors such as task-technology fit, self-efficacy, individual contingencies, and social factors such as subjective norm. Finally, the study argues that women, younger people, well-educated employees, and people with managerial experience are keen in adopting new technologies in the hotel industry in Greece.

Keywords: Greece, Hotel Industry, Self-Efficacy, Subjective Norm, Task-Technology Fit, Technology Acceptance Models

INTRODUCTION
It is well accepted that information technology (IT) is largely influential in certain parts of the service industry such as hospitality and tourism (Andreu, Aldas, Bigne, & Mattila, 2010; Buhalts & Law, 2008). This is because the industry of hospitality and tourism is highly information intensive (Camison, 2000). As such, hotel managers in trying to improve cost and operational efficiency, and in turn to improve the competitiveness of their businesses, have been utilizing information technologies in the last decade (Huh, Kim, & Law, 2009). Therefore, “the extent to which hotel staff accept IT at work is thus of paramount importance to the success of a hotel’s business” (Huh et al., 2009, p. 121).

However, few studies have been conducted in the context of the hotel environment investigating the acceptance of IT at work (Lam, Cho, & Qu, 2007). These studies tried to examine the degree to which Davis’s (1986) Technology Acceptance Model (TAM) and its extensions was applicable to the hospitality and tourism industry (Kaplanidou & Vogt, 2006; Kim, Lee, & Law, DOI: 10.4018/jsesd.2011040102
Thus, it is argued that the employee acceptance of information technologies research in the hospitality and tourism context is in its infancy stage (Huh et al., 2009).

To fill this gap, and further examine the process through which perceived IT beliefs influence behavioural intention to use IT in a non-US/UK context, this paper investigates how employee attitudes, mediate this process in the Greek hotel industry context. The hotel industry is a leading industry in Greece, employing 9.3 percent of the economically active population of Greece and contributing 15.20 percent to gross domestic product of Greece (SETE, 2010). Specifically, based on Lam et al. (2007), we present and test an operational model where individual factors such as task-technology fit, self-efficacy, and individual contingencies, and social factors such as subjective norm have a major influence on the state on technology acceptance, indicating that perceived IT beliefs influence behavioral intention through employee attitudes. Therefore, it is clear that the purpose of this paper is twofold:

- To investigate the causal relationship between perceived IT beliefs and behavioural intention in the Greek hotel industry context.
- To improve the understanding of why and how perceived IT beliefs influence behavioural intention to use IT in the Greek hotel industry context.

To investigate the relationship between perceived IT beliefs and behavioural intention in the Greek hotel industry context, we start in the next section with the presentation of the main elements of the theoretical background, we discuss an operational model, and we develop the hypotheses to be tested. This is followed by details of methodology adopted for this analysis. The next section summarizes the results and then it presents discussion with respect to key findings. Finally, the main conclusions of the study are presented, along with the contributions, limitations, and implications of the analysis.

OPERATIONAL MODEL AND HYPOTHESES

This study is mainly based on two contributions. First, the contribution of Davis, Bagozzi, and Warshaw (1989), where the perceived usefulness and the perceived ease of use have been identified by Davis (1989) and Venkatesh and Davis (2000) as the two basic determinants for the intention of individuals to use a new information technology system, in the so-called technology acceptance models (TAM). Perceived ease of use refers to “the degree to which a person believes that using a particular system would be free of effort”, perceived usefulness refers to “the degree to which a person believes that using a particular system would enhance his or her job performance”, and intention of use refers to “the behavioural intention to use the system” (Davis, 1989, p. 320). Second, the contribution of Goodhue and Thompson (1995), who by extending the TAM model assumed that the task-technology fit influences the use of a new information technology system, in the so-called task-technology fit (TTF) models. Considering that tasks are the “actions carried out by individuals in turning inputs to outputs”, task-technology fit refers to “how well the new technology fits with the tasks it supports” (Lam et al., 2007, p. 53).

Building on these two contributions, Figure 1 presents an operational model linking employee perceived IT beliefs and employee behavioural intention to use IT. The proposed operational model assumes that positive employee perceived IT beliefs will create improved employee attitudes towards using IT, which in turn will lead to higher employee behavioural intention to use IT. In particular, the parts of the proposed model are presented in Figure 1:

Antecedents to Employee Perceived IT beliefs

There are usually five concepts that constitute employee perceived IT beliefs (Lam et al., 2007). ‘Perceived usefulness’, which is the perception of employees that refers to the
